

CDM-RHD is a resilient head detail providing isolation for the head connection of a dry or wet wall from the soffit above whilst also providing a mechanism for lateral restraint

System features:

- CDM-RHD comprises:
 - Dry Walls - a head strip, two side strips and a stabilising bearing to isolate the mechanical fixing
 - Wet Walls – a head strip and two side strips
- CDM-RHD can be tuned so that it doesn't interfere with the natural frequency of the supporting base isolation strip

System benefits:

- Ease of installation
- CDM-RHD can be used as part of a fully isolated system incorporating floating floors and isolated ceilings to provide a box-in-box construction

In order to specify the correct CDM-RHD our engineers will need to know the wall type and width and the spacing and diameter of any fixings used to fix the top track to the soffit.
